## Single and multi-bunch tracking for PERLE

## K. André for the PERLE collaboration - k.andre@cern.ch

## Outline :

- ERL lattice and optics design
- Effect of the RF curvature
- Single bunch tracking studies including CSR
- Multi-bunch tracking studies
- Effect of LRW with bunch intensity
- Effect of LRW with bunch recombination pattern

| Parameter | Unit | Electron |
| :--- | :---: | :---: |
| Injection energy | MeV | 7.0 |
| Top energy | MeV | 500.0 |
| Beam current | mA | 20.0 |
| Bunch population | $10^{9} e^{-}$ | 3.1 |
| Bunch charge | pC | 500 |
| Bunch spacing | ns | 25 |
| Normalised emittance | $\mathrm{mm} . \mathrm{mrad}$ | 6.0 |
| RMS bunch length | mm | 3.0 |
| Longitudinal emittance | $\mathrm{keV} . \mathrm{mm}$ | 25.0 |
| RF frequency | MHz | 801.6 |

Kevin André - ERL 2022-04/10/2022

## ERL construction - Lattice splitting for the timing in PLACET2

The linac is $27 \lambda_{R F}$ including the injection chicane, the injection chicane was included into arc 2, 4, 6 such that only the cryomodule and the doublet of quadrupole are in the "linac lattice".

The linac becomes $24 \lambda_{\mathrm{RF}}$ long, The chicane is $3 \lambda_{\mathrm{RF}}$ (merged in the arcs) The arcs $2,4,6$ are respectively $63,63,66.5 \lambda_{\text {RF }}$ long while the arcs $1,3 \& 5$ are all $56 \lambda_{R F}$ long.

## Individual arc optics

Isochronous Arc (1, 3, 5) Optics
Isochronous Arc (2, 4, 6) Optics

The momentum compaction factor is < 2e-5 for all arcs according to Optim.

## Multi-turn optics

## Magnets apertures

Quadrupoles : 40 mm diameter aperture

Cavities: 130 mm diameter aperture
$\mathrm{H} / \mathrm{V}$ dipoles : 40 mm aperture for the smallest transverse direction \& 90 mm aperture in the other transverse direction.

## PLACET2 tracking code has been used because it features:

- Coherent Synchrotron Radiation (CSR) benchmarked with M. Dohlus, T. Limberg Nucl. Inst. and Meth. in Phys. Rev. A (393) 1997, see ref.
- and short and long-range wakefields based on SPL cavities scaled to 802 MHz .

## Longitudinal phase space curvature from the RF field

A hook shape forms and bunch elongation is visible as the initial bunch length increases. A longitudinal matching can mitigate the bunch elongation see Gustavo's talk. The nominal r.m.s bunch length of 3.0 mm has been reduced to 1.4 mm r.m.s bunch length to perform single and multi-bunch tracking studies.

Kevin André - ERL 2022-04/10/2022

## CSR and longitudinal binning

The number of nodes in the dipole doesn't change the behavior.

However the binning of the beam along the longitudinal axis does.

A minimum number of particles is required to mitigate the wakefield noise (no smoothing is applied).

## CSR and longitudinal binning

Kevin André - ERL 2022-04/10/2022

## CSR with beam current increase

$\sigma_{5, \text { ini }}=2.6 \cdot 10^{-3}| | \sigma_{s}=1.4 \mathrm{~mm}| | I_{e}=35 \mathrm{~mA}$

CSR with initial relative energy spread variation, $\mathrm{I}_{\mathrm{e}}=20 \mathrm{~mA}$

## Plain tracking - bunch length of $3.0 \mathrm{~mm}-20 \mathrm{~mA}$

The normalised emittance at injection is $\mathbf{6 m m}$ mrad

The longitudinal emittance at injection is $\mathbf{2 5} \mathbf{~ k e V . m m}$ $\sigma_{\delta, \text { ini }}=1.210^{-3}, \sigma_{\mathrm{s}}=3.0 \mathrm{~mm}$

The tracking results in 99.5 \% transmission without CSR.

## Tracking including CSR - bunch length of $1.4 \mathrm{~mm}-20 \mathrm{~mA}$

The normalised emittance at injection is $\mathbf{6 m m} . \mathrm{mrad}$ The longitudinal emittance at injection is $\mathbf{2 5} \mathbf{~ k e V . m m}$ $\sigma_{\bar{\delta}, \mathrm{ni}}=2.610^{-3}, \sigma_{\mathrm{s}}=1.4 \mathrm{~mm}$

64 bins - 250000 macro particles

## Tracking including CSR - bunch length of $1.4 \mathrm{~mm}-20 \mathrm{~mA}$

The normalised emittance at injection is $\mathbf{6 m m} . \mathrm{mrad}$ The longitudinal emittance at injection is $\mathbf{9 8} \mathbf{~ k e V . m m}$
$\sigma_{\delta, \text { ini }}=10^{-2}, \sigma_{\mathrm{s}}=1.4 \mathrm{~mm}$

64 bins - 250000 macro particles

Kevin André - ERL 2022-04/10/2022

## Tracking including CSR - bunch length of $1.4 \mathrm{~mm}-40 \mathrm{~mA}$

The normalised emittance at injection is $6 \mathbf{~ m m} . \mathrm{mrad}$

The longitudinal emittance at injection is $\mathbf{9 8} \mathbf{~ k e V . m m}$
$\sigma_{\delta, \text { ini }}=10^{-2}, \sigma_{\mathrm{s}}=1.4 \mathrm{~mm}$

64 bins - 250000 macro particles

Kevin André - ERL 2022-04/10/2022

## Tracking including CSR - bunch length of $1.4 \mathrm{~mm}-45 \mathrm{~mA}$

The normalised emittance at injection is $\mathbf{6 ~ m m} . \mathrm{mrad}$

The longitudinal emittance at injection is $\mathbf{9 8} \mathbf{~ k e V . m m}$
$\sigma_{\delta, \text { ini }}=10^{-2}, \sigma_{\mathrm{s}}=1.4 \mathrm{~mm}$

64 bins - 250000 macro particles

Kevin André - ERL 2022-04/10/2022

## Tracking including CSR - bunch length of $1.6 \mathrm{~mm}-45 \mathrm{~mA}$

The normalised emittance at injection is $\mathbf{6 ~ m m} . \mathrm{mrad}$

The longitudinal emittance at injection is $\mathbf{1 1 2} \mathbf{~ k e V . m m}$ $\sigma_{\delta, \text { ini }}=10^{-2}, \sigma_{\mathrm{s}}=1.6 \mathrm{~mm}$

64 bins - 250000 macro particles

Kevin André - ERL 2022-04/10/2022

## Tracking including CSR - bunch length of $1.8 \mathrm{~mm}-45 \mathrm{~mA}$

The normalised emittance at injection is $\mathbf{6 ~ m m} . \mathrm{mrad}$

The longitudinal emittance at injection is $\mathbf{1 2 6} \mathbf{~ k e V . m m}$ $\sigma_{\delta, \text { ini }}=10^{-2}, \sigma_{\mathrm{s}}=1.8 \mathrm{~mm}$

64 bins - 250000 macro particles

Kevin André - ERL 2022-04/10/2022

## Multi-bunch tracking studies

## The multi-bunch tracking studies consist of:

The tracking of 5000 macro particles per bunch, with the injection of 10000 bunches, one every 25 ns.
Follow the evolution of the transverse HOM amplitudes while varying the number of particles per bunch and/or bunch filling pattern.

Three areas have been studied:

- Modification of the bunch filling pattern;
- Such that the most disturbed bunch is as far as possible from the newly injected bunches,
- Such that the injection is "regular".
- Implement the frequency detuning of the HOM from cavity to cavity that happens naturally due to the geometry imperfections.

| Mode \# | f [GHz] | $\mathrm{A}\left[\mathrm{V} / \mathrm{C} / \mathrm{m}^{2}\right]$ | $Q$ | Mode \# | f [GHz] | $\mathrm{A}\left[\mathrm{V} / \mathrm{C} / \mathrm{m}^{2}\right]$ | $Q$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0.9151 | 9.323 | 1 e 5 | 14 | 1.675 | 4.160 | 1 e 5 |
| 2 | 0.9398 | 19.095 | 1 e 5 | 15 | 2.101 | 1.447 | 1 e 5 |
| 3 | 0.9664 | 8.201 | 1 e 5 | 16 | 2.220 | 1.427 | 1 e 5 |
| 4 | 1.003 | 5.799 | 1e5 | 17 | 2.267 | 1.377 | 1 e 5 |
| 5 | 1.014 | 13.426 | 1 e 5 | 18 | 2.331 | 2.212 | 1 e 5 |
| 6 | 1.020 | 4.659 | 1 e 5 | 19 | 2.338 | 11.918 | 1 e 5 |
| 7 | 1.378 | 1.111 | 1 e 5 | 20 | 2.345 | 5.621 | 1 e 5 |
| 8 | 1.393 | 20.346 | 1e5 | 21 | 2.526 | 1.886 | 1e5 |
| 9 | 1.408 | 1.477 | 1 e 5 | 22 | 2.592 | 1.045 | 1 e 5 |
| 10 | 1.409 | 23.274 | 1 e 5 | 23 | 2.592 | 1.069 | 1 e 5 |
| 11 | 1.607 | 8.186 | 1 e 5 | 24 | 2.693 | 1.256 | 1 e 5 |
| 12 | 1.666 | 1.393 | 1 5 | 25 | 2.696 | 1.347 | 1 5 |
| 13 | 1.670 | 1.261 | 1e5 | 26 | 2.838 | 4.350 | 1 e 5 |

Frequency, Amplitude and Q-value of the transverse HOM modes. The HOM frequencies are based on the SPL cavity with amplitudes scaled to the PERLE RF frequency. The Q-value is the worst from the TESLA cavity.

Previous multi-bunch tracking studies with long-range wakefields from D. Pellegrini featuring the CDR version of the PERLE lattice showed a BBU threshold between 10e9 and 12e9 electrons per bunch $\equiv 77 \mathrm{~mA}$.

## Multi-bunch tracking studies and filling pattern

Filling Pattern - Pathlength 'Arithmetic' $\quad \circ \bullet$ PERLE

- $20 \times \lambda_{\text {RF }}$ spacing between consecutive injections ( 25 nsec injection),
- Painting a 'uniform' bunch pattern for accelerated and decelerated bunches
- Pass-by-pass pathlengths (in units of $\lambda_{R F}$ ).

| - Pass 1: | $8 \times 20+n_{1}$ | $\mathrm{n}_{1}=7$ | - $\mathrm{A}_{1}=56$ |
| :---: | :---: | :---: | :---: |
| - Pass 2: | $8 \times 20+\mathrm{n}_{2}$ | $\mathrm{n}_{2}=6$ | - $\mathrm{A}_{2}=57$ |
| - Pass 3: | $8 \times 20+\left(n_{3}+1 / 2\right)$ | $\mathrm{n}_{3}=3,10,17$ | $\text { - } A_{3}=56$ |
| - Pass -2: | $8 \times 20+\mathrm{n}_{-2}$ | $\mathrm{n}_{-2}=6$ | - $\mathrm{A}_{5}=56$ |
| - Pass -1: | $8 \times 20+n_{-1}$ | $\mathrm{n}_{-1}=\mathbf{7}$ | - $\mathrm{A}_{6}=601 / 2$ |

_ Jefferson Lab _ Thomas Jefferson National Accelerator Facility
$\begin{array}{lll}\text { Sparatod by JSA tor the us. Department of Energy } & \text { Alex Bogacz } \quad \text { DIS Workshop, Stony Brook, NY, April 12-16, 2021 } & 18\end{array}$

The lattice design is based on a $7-7-10.5 \lambda_{\text {RF }}$ path-length adjustment during the first, second and third turns to alternate accelerating (1, $2 \& 3$ ) and decelerating (4, $5 \& 6$ ) bunches.
$7,6,10.5 \lambda_{\text {RF }}$ path-length adjustment combines regular injections and alternation of the bunches.
7, 7, 2.5 $\lambda_{R F}$ path-length adjustment combines maximal distance between (6) (1) and bunches alternation.

## Multi-bunch tracking studies

$5.0 \times 10^{10}$ electrons per bunch

## Multi-bunch tracking studies

## Multi-bunch tracking studies summary

Comparison of the HOM amplitude quadratic means for:

- The nominal 20mA and path-length adjustment 7-7-10.5
- 200 mA and path-length adjustment 7-7-10.5
- 200 mA and path-length adjustment 7-6-10.5
- 260 mA and path-length adjustment 7-7-10.5
- 260 mA and path-length adjustment 7-6-10.5
- 400 mA and path-length adjustment 7-7-10.5
- 400 mA and path-length adjustment 7-6-10.5

## Summary

- PERLE lattice design includes two experimental areas with low beta insertions.
- Tracking simulations have been performed with a reduced bunch length ( 1.4 mm ) until the lattice providing a longitudinal matching is available.
■ Lossless particle tracking including CSR and short range wakefields with a 1.4 mm r.m.s bunch length is achieved until 45 mA (2.25 times nominal)
- Multi-bunch tracking is stable at nominal current, the optimisation of the bunch filling pattern does not show unstable HOM up to 10 times the nominal current.
