

# Characterization of F5 Quad Module at Cornell

Xuan Chen, Joseph D. Grassi, Jose A. Monroy, Rainer Wallny

**CLASSE**  
Cornell Laboratory for Accelerator-based Science & Education

UIC Logo maybe

OSU Logo maybe

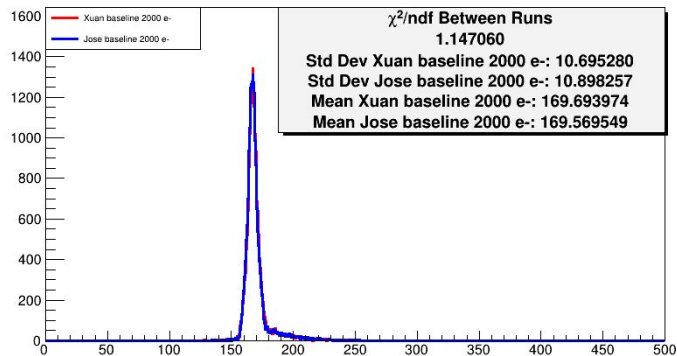

- ❖ **Consistency comparison**
  - Do separate runs behave in sufficiently similar fashion
  - $\chi^2$  as arbitrary figure of merit
  
- ❖ Equivalent runs behave consistently, with the exception of chip 7 which is a little erratic.

Chip 4

Chip 5

Chip 6

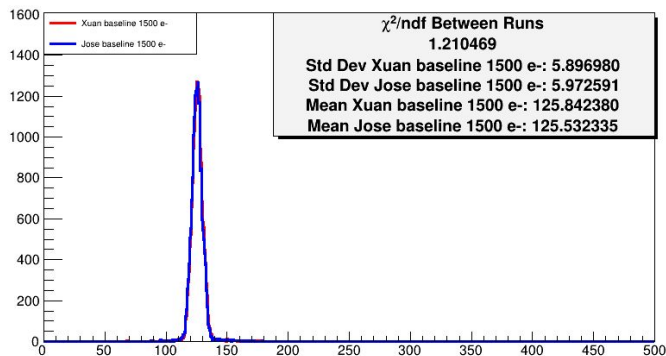

Chip 7

Chip 4

Chip 5

Chip 6

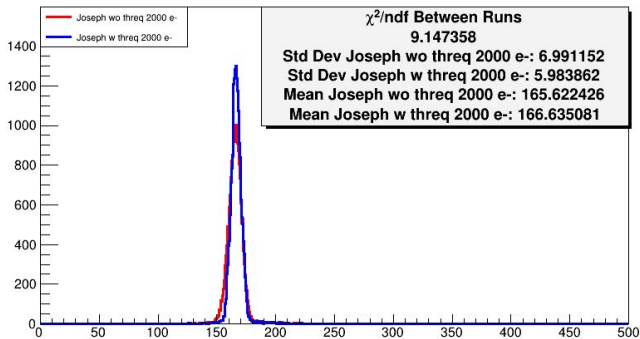

Chip 7

- ❖ **Comparison with and without threqu after thradj**
  - Significantly worse S curves result without threqu step
  - Threqu step is quick and could to be included, but could also be skipped  
I think

Chip 7

Marginal effect even with the threqu at the end of the program

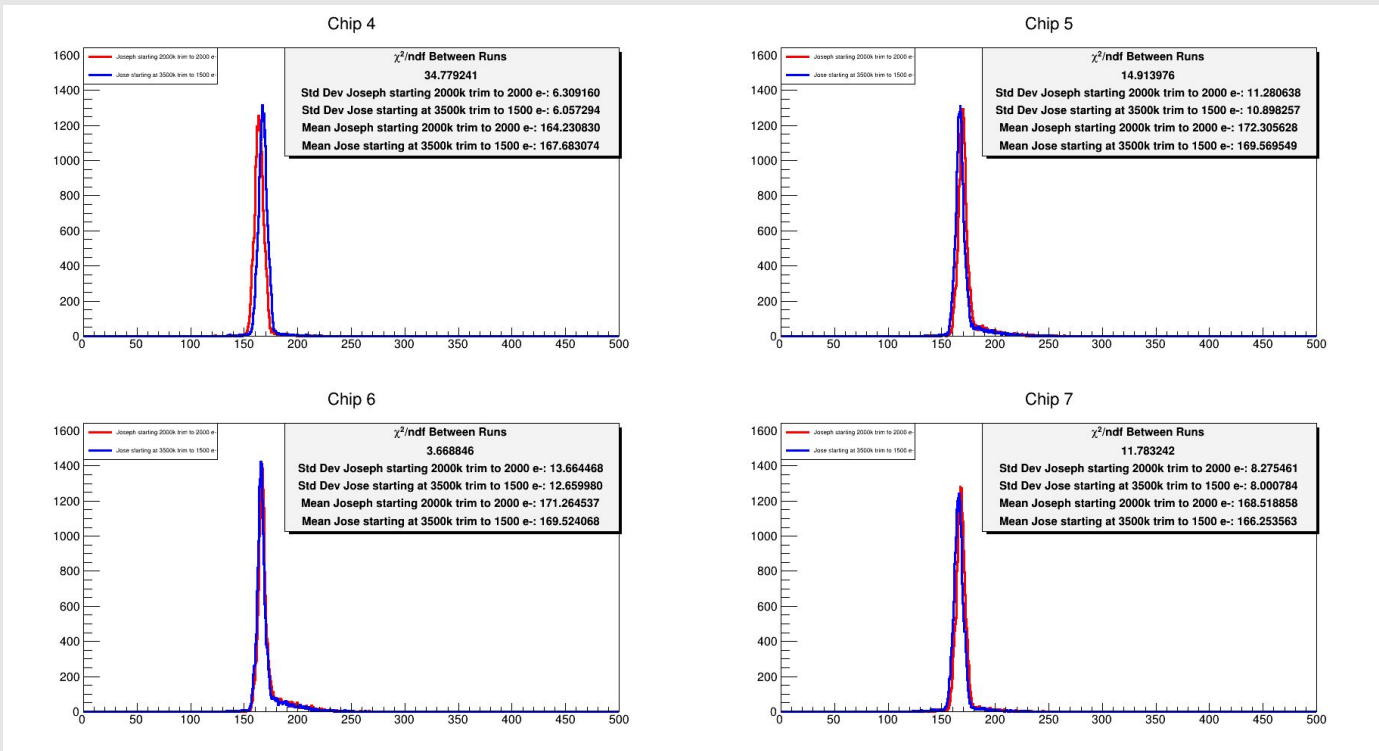

- ❖ **Comparison with starting at 3500 e- vs 2000 e-**
  - Threshold spread is comparable, location of threshold slightly changes
  - As long as standardized, don't see issue with starting at 2000 e-
  -

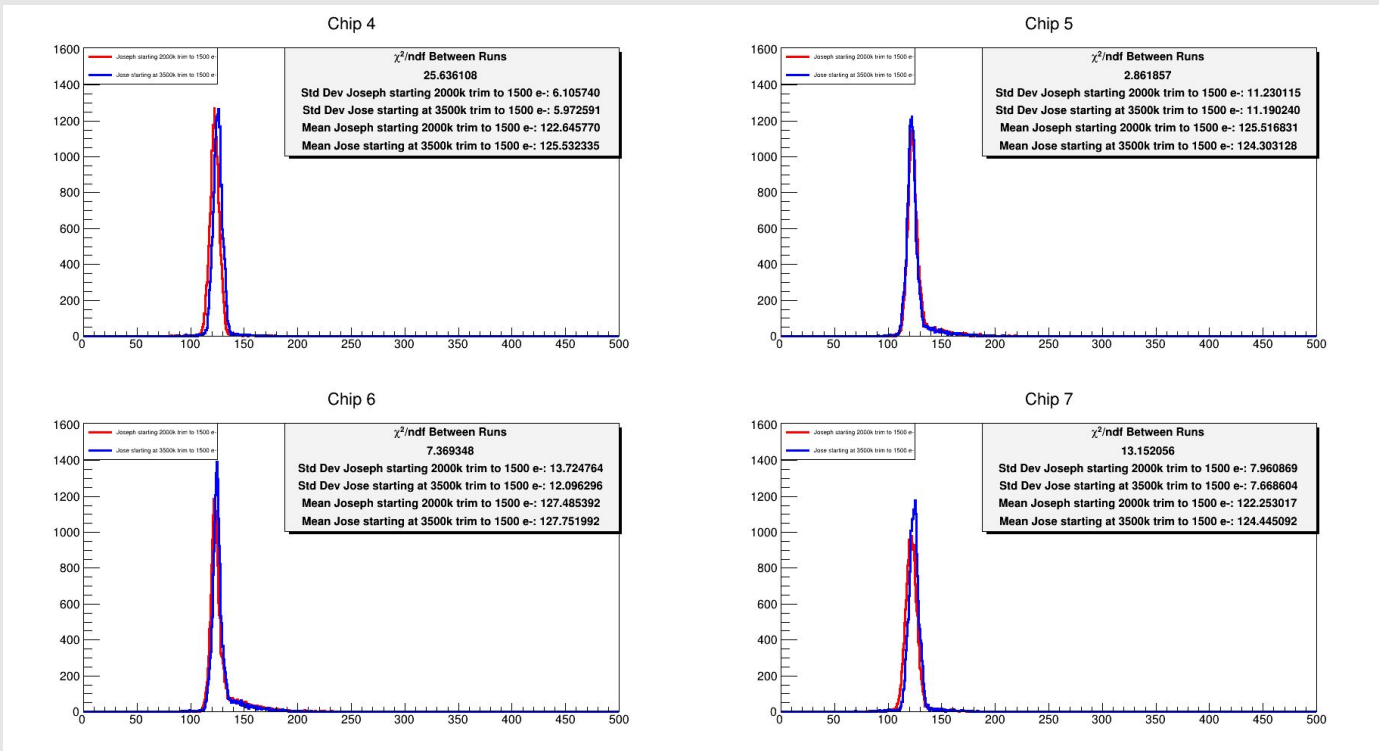

## 2000 e- S-Curve Compare

```
const char file_dir_1[200] = "/home/joseph/Documents/Cornell/CMS/TFPX/Electronics_Readout/F5_comparisons/jdg_quad_v11_maxTrim/Results/Run000004_SCurve.root";
const char file_dir_2[200] = "/home/joseph/Documents/Cornell/CMS/TFPX/Electronics_Readout/F5_comparisons/033023/Results/Run000008_SCurve.root";
```

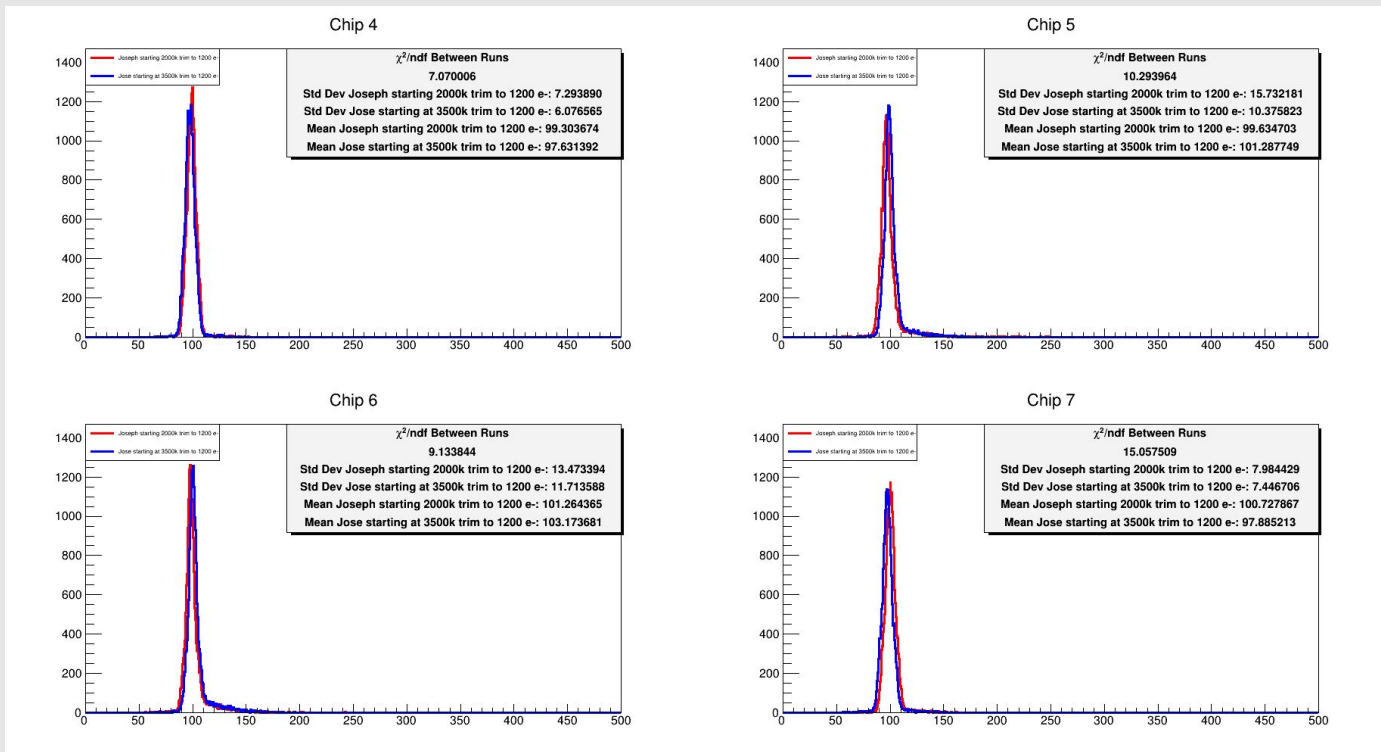

## 1500 e- S-Curve Compare

```
const char file_dir_1[200] = "/home/joseph/Documents/Cornell/CMS/TFPX/Electronics_Readout/F5_comparisons/jdg_quad_v11_maxTrim/Results/Run000007_SCurve.root";
const char file_dir_2[200] = "/home/joseph/Documents/Cornell/CMS/TFPX/Electronics_Readout/F5_comparisons/033023/Results/Run000012_SCurve.root";
```

## 1200 e- S-Curve Compare

```
const char file_dir_1[200] = "/home/joseph/Documents/Cornell/CMS/TFPX/Electronics_Readout/F5_comparisons/jdg_quad_v11_maxTrim/Results/Run000027_SCurve.root";  
const char file_dir_2[200] = "/home/joseph/Documents/Cornell/CMS/TFPX/Electronics_Readout/F5_comparisons/033023/Results/Run000018_SCurve.root";
```

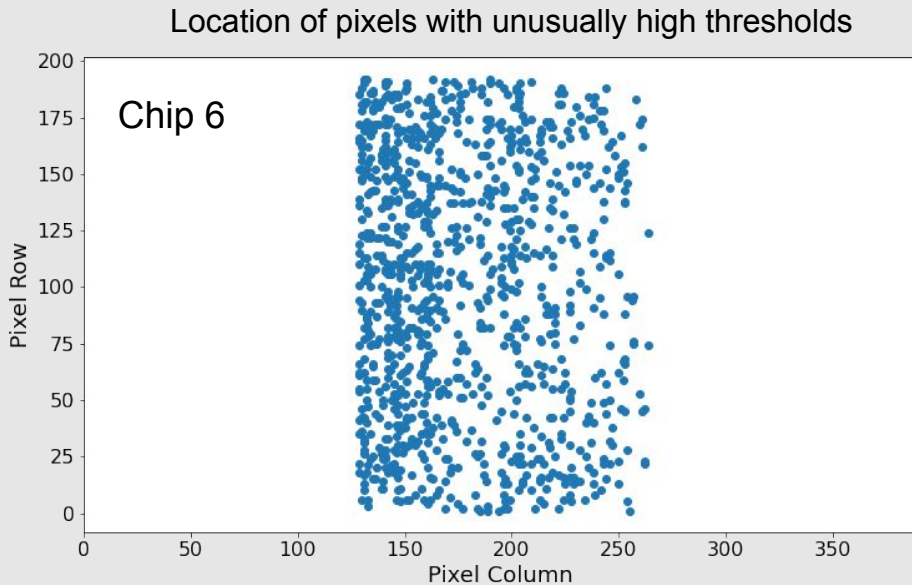

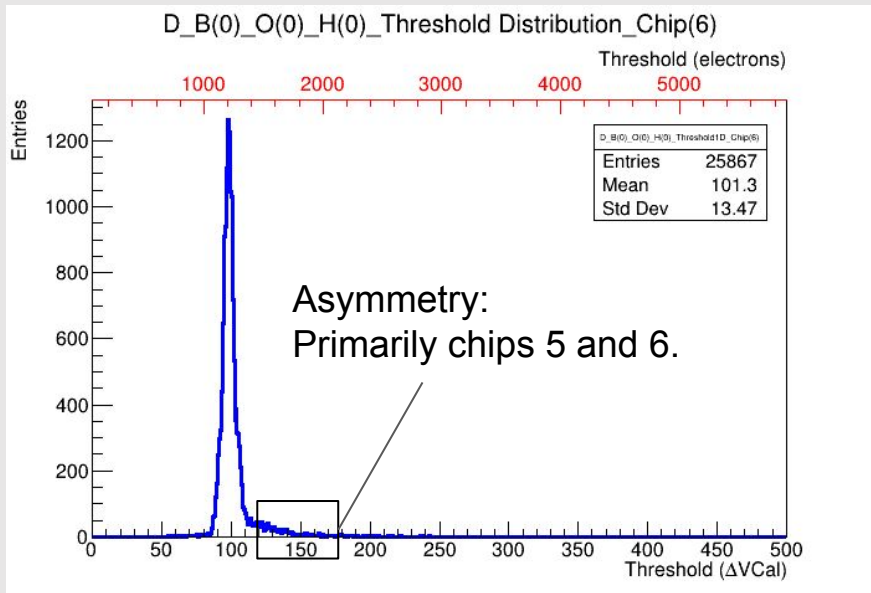

- ❖ **Maximum trims obtained:**
  - 1200 e- before too many masked pixels for Jose and Joseph.
    - Some chips had as many as 1000 noisy pixels, but some far lower. (Chip 6 misbehaves and has nearly a thousand noisy pixels at this level). Chip 4 and 7 have noise 146, 197 masked pixels.
  - 1000 achieved by Xuan, with (I think) 600 noisy pixels per chip
- ❖ Which should I show?

- ◆ **Investigations of the tails in thresholds**
  - Appears at multiple trim values (2000,1500,1200)

## Pixels with high thresholds
